Not your Father’s Glazing: Understanding the Fire-Rated Glazing of Today

Rich Walke
UL Codes and Advisory Services
Agenda

• Introductory Comments on Fire-rated Glazing
• Types of Fire-rated Glazing
• Fire Testing of Glazing Materials
• Code Requirements for Fire-rated Glazing
• Marking Requirements for Glazing
• Installation Standards
Agenda Cont.

- Where are Listings Found?
- UL’s Online Resources
- Summary and Closing
Key Purposes of Fire-rated Glazing

- Allows visibility into a space
- Prevents spread of fire (compartmentation)
Uses of Fire-rated Glazing

• As a fire-resistance-rated wall assembly
• Vision panels in fire rated door assemblies
• Transom and sidelight panels used adjacent to fire doors
• Fire window assemblies
What Type of Glazing is Required?

• The type of glazing required for each of these applications is based on the following:
  • Type of barrier
  • Rating of barrier
  • Size of glazing panel
• The type of glazing required is found in the International Building Code and the Life Safety Code
Types of Fire-rated Glazing

• Fire-rated glazing
  • Fire-resistance-rated glazing
    • Fire-resistance-rated glazing used in walls
    • Fire-resistance-rated glazing used in walls and fire door applications
  • Fire-protection-rated glazing
    • Fire-protection-rated glazing w/o hose stream
    • Fire-protection-rated meeting hose stream requirements
    • Fire-protection-rated meeting hose steam and temperature requirement
Key Attributes for Fire and Human Impact Safety

- **Fire Test** - Measures the amount of time, in minutes or hours, that fire-rated glazing and framing can withstand fire exposure in a furnace.

- **Hose Stream Test** - Heated glass and frames are subjected to water from a hose stream. The cooling, impact and erosion created by the hose stream evaluates the structural integrity of the glazing and frame.
Key Attributes for Fire and Human Impact Safety Cont.

• **Impact Safety Test** - Measures the ability of glass to withstand impact. Ratings are given in levels based on the amount of force the glass can resist. Typically defined by CPSC Category 1 or 2 rating.
Fire-resistance-rated Glazing

- “Thick” glazing
- Stops fire **AND** radiant heat
- Classified as a “wall” rather than an opening (window)
- Meets same requirements as a gypsum or CMU wall
- When use in walls, both glass and frame must block passage of heat

TGP Slide, Image
Fire-resistance-rated Glazing Cont.

- May be used in multi story spans or floor to ceiling sizes, but may not exceed manufacturers tested size.
- When used in doors, must also meet requirements of hose stream after full fire exposure.
Standards
Fire-resistance-rated Glazing

• When used as a wall
  • UL 263 / ASTM E119

• When used as vision panel in doors
  • UL 263 / ASTM E119,
  • UL 10B / UL 10C / NFPA 257, and
  • In 2012 and later codes, glazing in excess of 100 sq in. in doors in interior exit stairways, ramps and exit passageways is required to be fire-resistance-rated and shall have a max temperature rise of 450°F for 30 minutes
Conditions of Acceptance
UL 263 / ASTM E119

• Flame Passage
• 250°F / 325°F Temperature Rise
• Hose Stream on Duplicate Test Sample Exposed to Fire for Reduced Time Frame
Conditions of Acceptance
UL 10B / UL 10C / NFPA 257

• Flame Passage
• Hose Stream after Full Duration Fire Exposure
  • Limited Openings (Max 5% Fall-Out) Permitted
Fire-protection-rated Glazing

- Fire-rated, thin glazing
- Traditional fire-rated material (wired glass, proprietary glass, etc.)
  - Traditional wired glass does not meet safety glazing requirements
- Allows significant radiant heat from unexposed side
- May or may not meet hose stream and temperature requirements
Fire-protection-rated Glazing Cont.

• Used as Opening Protectives
  • Fire Windows: 20 to 90 minutes
  • Fire Doors: 20 minutes to 3 hrs
  • May not exceed 25% of the area of a fire-resistance-rated wall
  • Size shall comply with IBC and NFPA 80, and may not exceed manufacturers tested sizes
Standards
Fire-protection-rated Glazing

• Glazing used in fire door assemblies
  • UL 10C / NFPA 252 (side hinged or swinging fire door assemblies)
  • UL 10B / NFPA 252 (all other types of fire door assemblies)
• In 2009 and earlier codes, fire-protection-rated glazing in excess of 100 sq in. in doors in exit enclosures and exit passageways was required to have a max temperature rise of 450°F for 30 minutes
Standards
Fire-protection-rated Glazing Cont.

- In 2012 and later codes, fire-protection-rated glazing in excess of 100 sq in. in doors in exit enclosures and exit passageways is not permitted
- Glazing used in fire window assemblies
  - UL 9 / NFPA 257
Conditions of Acceptance
UL 10C / UL 10B / NFPA 252

• Flame Passage

• Hose Stream after Full Duration Fire Exposure
  • Limited Openings (Max 5% Fall-Out) Permitted
  • When used in some 20 min fire door applications, the code waives the requirement for the hose stream test
Conditions of Acceptance
UL 9 / NFPA 257

• Flame Passage
• Hose Stream after Full Duration Fire Exposure
  • Limited Openings (Max 5% Fall-Out) Permitted
Fire Testing of Glazing Materials
Fire Door Assembly Ready for Testing

Glazing  Door  Frame  Hardware
Fire Door / Fire Window Assemblies Under Test
Fire Door Assemblies with Glazing Under Test
Hose Stream Test
Code Requirements for Fire-Rated Glazing
Component Approach Used for Fire Door and Fire Window Assemblies

• Both documents prescribe a component approach for fire door and fire window openings
• IBC and NFPA 101 by referencing NFPA 80 require fire door components to be Listed and Labeled
Component Approach Used for Fire Door and Fire Window Assemblies

• Approval of the finished opening protective relies on Listing and ratings of individual components with final decision up to the Code Official
Glazing in Fire Doors

• Section 716.5 of the 2015 IBC
• 716.5.1 – Side-hinged or pivoted swinging doors shall be tested to UL 10C or NFPA 252
• 716.5.2 – Other types of doors shall be tested to UL 10B or NFPA 252
• Table 716.5 – Establishes requirements for rating on door based on required vertical assembly rating
# TABLE 716.5 OPENING FIRE PROTECTION ASSEMBLIES, RATINGS AND MARKINGS

</table>
Glazing in Fire Doors Cont.

• 716.5.8.3 - Glazing in fire doors shall be labeled

• 716.5.8.4 - Glazing in and around fire doors must meet safety glazing criteria
  • Wired glass not permitted in or around fire doors
Glazing in Fire Windows

• Section 716.6 of the 2015 IBC
• 716.6.1 – Fire-protection-rated glazing tested to positive pressure UL 9 or NFPA 257 test. Must meet fire and full duration hose stream requirements.
• 716.6.4 – Glazing in and around fire windows must meet safety glazing criteria
  • Wired glass not permitted in or around fire doors
Glazing in Fire Windows Cont.

• 716.6.4 – Maximum size of fire-protection-rated glazing shall comply with NFPA 80
• 716.6.8 – Glazing shall be labeled
History Behind Wired Glass

• 2003 and earlier editions of IBC required glazing in areas subject to human impact in hazardous locations to meet safety glazing requirements

• 2406.1.1 – All glazing in hazardous location shall comply with CPSC 16 CFR 1201
  • Exception: Wired glass in fire doors and fire windows complying with ANSI Z97.1
History Behind Wired Glass Cont.

• Nominal ¼ in. wired glass does not comply with CPSC, but does comply with ANSI Z97.1. As such, it was permitted.
• Exception relating to ANSI Z97.1 removed from 2006 edition of IBC. As such, nominal 1/4 in. wired glass no longer complies.
Fire-resistance-rated Glazing

• Fire-resistance-rated glazing may be utilized where
  • Required size of glazing exceeds code allowance
  • Code does not permit openings protected with fire-protection-rated glazing
Marking Requirements for Fire-rated Glazing

Without some identification, how does one distinguish the various types of glazing?

You can Not!!!
• Code required marking provides an easy method to confirm code compliance both at time of installation and during annual inspections
Marking Requirements for Glazing Cont.

• 2006 and later codes contain requirements for marking glazing with respect to its fire performance
• Requirement in 2012 IBC have changed
• 2012 and newer requirements define marking required for each code application of glazing
### 2015 IBC Marking

| NFPA 252 or UL 10B or UL 10C | D, H, T | - Meets fire door assembly criteria.        
|                           |         | - Meets fire door assembly "Hose Stream" test.                                   
|                           |         | - Meets 450°F temperature rise criteria for 30 minutes                             |
|                           | XXX     | The time in minutes of the fire resistance or fire protection rating of the glazing assembly |

•Note: 450° F = 250° C
For fire-protection-rated glazing used in Fire Door Assemblies, glazing marked: D – H – XXX, where:

- D indicates glazing meets the door assembly criteria
- H indicates the glazing has been subjected to hose stream test
- XXX indicates fire-protection rating in minutes
2009 IBC Marking
Requirements for Glazing Cont.

• For fire-protection-rated glazing used in Fire Door Assemblies, glazing marked: D – H or NH – T or NT – XXX, where:
  • D indicates glazing meets the door assembly criteria
  • H or NH indicates if glazing has been subjected to hose stream test or not
  • T or NT indicates if glazing meets 450°F temperature rise for 30 minutes or not
  • XXX indicates fire-protection rating in minutes
2015 IBC Marking
Requirements for Glazing Cont.

• For fire-resistance-rated glazing used in Fire Door Assemblies, glazing marked: D – H – T – W-XXX, where:
  • D indicates glazing meets the door assembly criteria
  • H indicates the glazing has been subjected to hose stream test
  • T indicates the glazing meets 450°F temperature rise
  • W indicates the glazing meets the wall assembly criteria
  • XXX indicates fire-protection rating in minutes
2015 IBC Marking Requirements for Glazing Cont.

• For glazing used in Fire Window Assemblies, glazing marked: OH – XXX, where:
  • OH indicates glazing indicates glazing meets the fire window criteria including the hose stream test
  • XXX indicates fire-protection rating in minutes
2015 IBC Marking
Requirements for Glazing Cont.

• For fire-resistance-rated glazing used as a wall, glazing marked: W – XXX, where:
  • W indicates glazing meets the wall assembly criteria
  • XXX indicates fire-resistance rating in minutes
NFPA 80 - Scope

• This standard regulates the installation and maintenance of assemblies and devices used to protect openings:
  • in walls,
  • in floors,
  • and in ceilings

“against the spread of fire and smoke”
• 4.2 Listed and Labeled Products
  • 4.2.1 Listed items shall be labeled
  • 4.2.2 Labels shall be applied in locations that are visible
  • 4.2.4 Specification of items of a generic nature, such as hinges, that are not labeled shall comply with the specifications contained in this standard.
NFPA 80 Requirements - Glazing

• **4.4.1*** Only labeled fire-resistance-rated or fire-protection-rated glazing material shall be used in fire door assemblies when permitted by the door listing.

• **4.4.2** Fire-protection-rated glazing and fire-resistance-rated glazing shall meet all applicable impact safety standards.
• **5.1.3 Replacement** When replaced, fire doors, shutters windows and component parts shall be replaced with components which meet the rating required for new installations.
• 5.2.4 Periodic Inspection and Testing

• 5.2.4.1* Periodic inspections and testing shall be performed not less than annually.

• 5.2.4.2 Requires inspection to same criteria as original acceptance testing.
5.5 Maintenance

5.5.1* Repairs shall be made, and defects that could interfere with operation shall be corrected without delay.

5.5.2 Damaged glazing material shall be replaced with labeled glazing.

5.5.3 Replacement glazing materials shall be installed in accordance with their individual listing.
